

Requester - Meri Pehchaan API Specification

Version 2.4

Sep 2026

A Digital India Initiative
National e-Governance Division.
Ministry of Electronics and
Information Technology.

Revision History

Version	Date	Comments
0.1	03/03/2017	Released draft version.
0.2	29/03/2017	Changed Upload File API parameters.
0.3	18/04/2017	Removed Content-Length parameter from Upload File API.
0.4	19/05/2017	Added error codes for APIs.
0.5	07/07/2017	Added support for signup flow and invalidate token APIs.
0.6	17/08/2017	Added APIs for limited input devices.
0.7	15/01/2018	Internal Release for UMANG
0.8	27/06/2018	Refresh Token for limited input devices.
0.9	20/08/2018	Updated Get Device Code API for Limited Input Devices to accept mobile number.
1.0	25/09/2018	Added Pull Document APIs
1.1	12/10/2018	Added Verify Account API
1.2	16/10/2018	Updated Pull Document API to return URI. Change authentication of Issuer, Document and Parameter APIs.
1.3	07/12/2018	Added provision to accept trusted mobile number in Get Authorization Code sign up flow. Added provision to skip demographic authentication in demographic authentication sign up API
1.4	12/04/2019	Added API to provide DigiLocker Id and user details. Added provision to provide certificate data in machine readable format.
1.5	17/06/2019	Updated Verify Account API to return digilockerid.
1.6	14/07/2019	Added DigiLocker Id and user details in Get Access Token response. Added Get Statistics API to get general DigiLocker statistics. Added doctype in Get List of Issued Documents API response. Added issuerid in the response of Get List of Issued Documents API and Get List of Issuers API.
1.7	12/03/2020	Added eadhaar indicator in token and Get User Detail API. Added Get e-Aadhaar Data in XML Format API. Updated Sign Up API to provide access token if account already exists. The API will not throw any error if account already exists for a give Aadhaar.
1.8	25/03/2020	Updated Get Authorization Code and Get Access Token APIs to support Proof Key for Code Exchange protocol for better security.
1.9	01/09/2020	Added new version of Get e-Aadhaar Data in XML Format API. The format of e-Aadhaar XML has been updated in this version.
1.10	10/12/2020	Added reference_key in token and Get User Detail API response. Added new_account field in Get Access Token response.
1.11	16/02/2021	Updated Get e-Aadhaar Data in XML Format API to version 3.
2.0	15/09/2022	Supported OpenID Connect protocol ,added , added get Access token API version 2, Removed APIs for limited input devices,refresh token API and access token v1 API,

2.1	26/10/2022	Updated Push URI API to support doccontent(PDF) and datacontent(XML)
2.2	24/03/2023	Updated scope and consent_valid_till in Get Access Token and Get Access Token (Openid connect protocol) and Refresh Access Token API response Updated API response with status codes in Get User Details, Get List of Self Uploaded Documents, Get List of Issued Documents, Get File from URI, Get Certificate Data in XML Format from URI and Get e-Aadhaar Data in XML Format Some text Changes Digital Locker to Digilocker
2.3	15/09/2023	Removed DigiLocker Sign up APIs using Aadhaar Demographic Authentication Added req_doctype, amr, pla, plsignup, ulsignup, consent_valid_till and purpose parameter in Get Authorization Code under Authorization APIs Added Revoke Session under Token/Session Revocation API
2.4	09/09/2026	Added mobile, picture and email in Get User Detail API response Added mobile and purpose in Get Access Token API response Removed Verify Account API Added Get Apaar Details API Added service name, prompt and login_hint parameters, updated accepted values for the purpose parameter and supported apaar, apaar_only and apaar_others value in the amr parameter in the Get Authorization Code endpoint under Authorization APIs Section

Requester - Meri Pehchaan API Specification

Introduction

DigiLocker is a key initiative under the Digital India program. It aims at eliminating the use of physical documents and enables sharing of verified digital documents across agencies. DigiLocker provides a dedicated personal storage space of 1GB in the cloud to citizens. It will enable various organizations registered on DigiLocker to push certificates of citizens directly in their DigiLocker in digital format. Citizens can also upload and securely store the scanned copies of legacy documents in DigiLocker. These legacy documents can be digitally signed using eSign facility. A citizen can share these digital certificates online with various departments and agencies registered on DigiLocker while applying for the services provided by them. Thus, DigiLocker brings the citizens, issuers and requestors on one platform.

This document provides technical details of DigiLocker integration with applications of trusted partners. This document assumes that the reader is aware of DigiLocker application functionality.

Authorization APIs (For Server Side Web Applications)

To access files in user's DigiLocker account from your application, you must first obtain user's authorization. DigiLocker APIs use the OAuth 2.0 protocol for authorization. DigiLocker supports common OAuth 2.0 scenarios such as those for web server, mobile applications and limited input devices such as printers and scanners. DigiLocker also supports the Proof Key for Code Exchange (PKCE) protocol for higher security of mobile application clients. For more information on OAuth 2.0 please refer to Internet Engineering Task Force's (IETF) documentation on The OAuth 2.0 Authorization Framework (<https://tools.ietf.org/html/rfc6749>), Proof Key for Code Exchange by OAuth Public Clients (<https://tools.ietf.org/html/rfc7636>) and OAuth 2.0 for Native Apps (<https://tools.ietf.org/html/rfc8252>).

Get Authorization Code

Call to this API starts authorization flow using OAuth 2.0 protocol. **This isn't an API call—it's a DigiLocker web page that lets the user sign in to DigiLocker and authorize your application to access user's data.** After the user decides whether or not to authorize your app, they will be redirected to the redirect link provided by your application.

URL STRUCTURE

Production Environment:

`https://digilocker.meripehchaan.gov.in/public/oauth2/1/authorize`

HTTP METHOD GET

PARAMETERS

- **response_type** (*required*) Provide the grant type parameter as "code".

- **client_id** (*required*) Provide the app id/client id that was created during the application registration process.
- **redirect_uri** (*required*) The URI to redirect the user after authorization has completed. This must be the exact URI registered in the DigiLocker Partner Portal.
- **state** (*required*) This is your application specific data that will be passed back to your application through *redirect_uri*.
- **code_challenge** (*required*) A unique random string called code verifier (*code_verifier*) is created by the client application for every authorization request. A *code_verifier* is a high-entropy cryptographic random string created using the unreserved characters [A-Z] / [a-z] / [0-9] / "-" / "." / "_" / "~", with a minimum length of 43 characters and a maximum length of 128 characters. The *code_verifier* should have enough entropy to make it impractical to guess the value.
The *code_challenge* sent as this parameter is the Base64URL (with no padding) encoded SHA256 hash of the code verifier.

```
code_challenge = base64_url_encode_without_padding(sha256(code_verifier))
```

Here is the pseudo code to implement a base64url-encoding function without padding, based upon the standard base64-encoding function that uses padding:

```
string base64_url_encode_without_padding(string arg)
{
    string s = base64encode(arg); //Regular base64 encoder with padding
    s = s.replace('=', ''); //Remove any trailing '='
    s = s.replace('+', '-'); //Replace '+' with '-'
    s = s.replace('/', '_'); //Replace '/' with '_'
    return s;
}
```

- **code_challenge_method** (*required*) Specifies what method was used to encode a *code_verifier* to generate *code_challenge* parameter above. This parameter must be used with the *code_challenge* parameter. The only supported values for this parameter is S256.
- **purpose** (*required*) - The purpose parameter is a required field in the authorization request. It defines the reason the client application is requesting user consent and is displayed on the consent screen to ensure transparency. The value must be a human-readable string using only alphabets (A-Z, a-z), numbers (0-9), spaces, and underscores.
- **service_name** (*required*) - The service_name parameter is a required field in the authorization request. It identifies the specific service or application for which the client is requesting authorization. The value must be a human-readable string using only alphabets (A-Z, a-z), numbers (0-9), spaces, and underscores. On the consent screen, service_name is displayed alongside purpose to give users full transparency about the service being requested.
- **dl_flow** (*optional*) If this parameter is provided its value will always be *signup*. This parameter indicates that the user does not have a DigiLocker account and will be

directed to the signup flow directly. After the account is created, the user will be directed to the authorization flow. If this parameter is not sent, the user will be redirected to the sign in flow.

- **verified_mobile** (*optional*) Verified mobile number of the user. If this parameter is passed, DigiLocker will skip the mobile OTP verification step during sign up. DigiLocker will treat the mobile number passed in this parameter as a verified mobile number by the trusted client application. This parameter will be used only if *dl_flow* parameter mentioned above is set to *signup* and will be ignored otherwise.
- **scope**(*optional*) If this parameter is provided its value will always be *openid*. This parameter indicates that client will receive "*id_token*" in response of "Get Access Token" API.
- **acr**(*optional*) If this parameter is provided its value will always be either *pan*, *aadhaar* or *driving_licence*. This parameter indicates that the user have to verify their authentic content recognition from Digilocker service, if user successfully verified acr then client will receive the verified acr data inside "*id_token*" in the response of "Get Access Token" API .
- **req_doctype** (*optional*) - If this parameter is provided, its value should be a comma-separated list of document types (e.g., "PANCR,DRVLC"). Only the specified document types will be displayed on the consent screen page for the user. These document types are selected from the ones that are approved for your client ID and requested by you.
- **amr** (*optional*)- If this parameter is provided, its value should be a space-separated list of authentication methods. The methods *driving_licence*, *aadhaar*, and *pan* are for signup only; *ndlemail* and *mobile* are for both sign-in and sign-up; and *apaar*, *apaar_only*, *apaar_others*, and *username* are for sign-in only. For the signup-only values (*driving_licence*, *aadhaar*, *pan*), this parameter will be used only if the *dl_flow* parameter mentioned above is set to *signup* and will be ignored otherwise.
- **pla** (*optional*)- If this parameter is provided, its value will always be "Y." This parameter will be used for pinless authentication.
- **plsignup** (*optional*) - If this parameter is provided, its value will always be "Y." This parameter will be used for pin less authentication during the signup process only.
- **ulsignup** (*optional*) - If this parameter is provided, its value will always be "Y." This parameter will be used for username less authentication during the signup process only.
- **consent_valid_till** (*optional*) - Provide a timestamp value in seconds using the UNIX (or POSIX) format and the IST time zone. This parameter represents the expiration date for the user's consent, if provided.
- **prompt** (*optional*) - If this parameter is provided, its value should be either *login* or *login_mobile*. The value *login* forces the user to perform a fresh login, while *login_mobile* prompts the authorization server to show the mobile-based login screen directly.
- **login_hint** (*optional*) - This parameter should only be used when the prompt parameter is set to *login_mobile*. Its value should be a mobile number (e.g., 953667XXX). This enables the mobile number field to be pre-filled during login for a smoother user experience.

RETURNS

Since /oauth2/1/authorize is a website, there is no direct return value. However, once a user successfully authorizes your app, the DigiLocker application will forward the flow to your redirect URI. The type of response varies based on the response_type.

If the response_type parameter is passed as code then the following parameters are returned in the query string:

- **code** The authorization code, which can be used to attain a bearer token by calling the Get Access Token API.
- **state** This is application specific data, if any, originally passed to /oauth2/1/authorize

ERRORS

If the request fails due to a missing, invalid, or mismatching redirection URI, or if the client identifier is missing or invalid, the flow will result in error response.

If the resource owner denies the access request or if the request fails for reasons other than a missing or invalid redirection URI, the following parameters will be included in the redirect URI:

- **error** An error code as per the OAuth 2.0 spec.
- **error_description** A user-friendly description of the error that occurred.
- **state** The state content originally passed to authorization flow if any.

Get Access Token(openid connect protocol)

This endpoint only applies to apps using the authorization code flow. An app calls this endpoint to acquire a bearer token once the user has authorized the app. Calls to /oauth2/2/token need to be authenticated using the app's key and secret. These can either be passed as application/x-www-form-urlencoded POST parameters (see parameters below) or via HTTP basic authentication. If basic authentication is used, the app key should be provided as the username, and the app secret should be provided as the password.

URL STRUCTURE

Production Environment:

`https://digilocker.meripehchaan.gov.in/public/oauth2/2/token`

HTTP METHOD POST

HTTP REQUEST HEADER

- *Content-Type: application/x-www-form-urlencoded*

PARAMETERS

- **code**(*required*) The code acquired by directing users to /oauth2/1/authorize?response_type=code.
- **grant_type**(*required*) The grant type, which must be authorization_code.
- **client_id** (*required*) If credentials are passed in POST parameters, this parameter should be present and should be the app key/client id.
- **client_secret** (*required*) If credentials are passed in POST parameters, this parameter should be present and should be the app's secret.
- **redirect_uri**(*required*) Only used to validate that it matches the original /oauth2/authorize, not used to redirect again.

- **code_verifier**(*required if code_challenge parameter is passed in authorization request*) The code_verifier created during authorization request. This parameter is mandatory for mobile client applications.

RETURNS

A JSON string containing following fields will be returned in response:

- **access_token** The access token that can be used to call the DigiLocker APIs.
- **expires_in** The duration in seconds for which the access token is valid.
- **token_type** The type of token which will always be Bearer.
- **scope** Scope of the token provided by the user and scopes are separated by space.
For example : files.issueddocs(*Access to user's Get List of Issued Documents API*) files.uploadeddocs(*Access to user's Get List of uploaded Documents API*) userdetails(*Access to user's Get Account Details API*) file.partners/PANCR(*Access to user's Pull Document API for fetching new PAN Card*) file.partners/DRVLC(*Access to user's Pull Document API for fetching new Driving License*) issued/in.gov.pan-PANCR-ABCDE1234F(*Access to user's Get File From URI API for PAN Card*) issued/in.gov.transport-DRVLC-DL0120230100001(*Access to user's Get File From URI API for Driving License*) openid(*Access to user's in id_token*)
- **id_token** This contain claims that carry information about the user. This response is JWT.
- **consent_valid_till** This contain the timestamp in UNIX format that carry information about the consent expire provided by the user .

Sample Response:

```

ERRORS

The authorization server responds with an HTTP status code as follows:

Code	Description
400	Bad request.
401	If the access token is expired or has been revoked by DigiLocker user.

Get Access Token

This endpoint only applies to apps using the authorization code flow. An app calls this endpoint to acquire a bearer token once the user has authorized the app. Calls to /oauth2/1/token need to be authenticated using the app's key and secret. These can either be passed as application/x-www-form-urlencoded POST parameters (see parameters below) or via HTTP basic authentication. If basic authentication is used, the app key should be provided as the username, and the app secret should be provided as the password.

URL STRUCTURE

Production Environment:

<https://digilocker.meripehchaan.gov.in/public/oauth2/1/token>

HTTP METHOD POST

HTTP REQUEST HEADER

- *Content-Type: application/x-www-form-urlencoded*

PARAMETERS

- **code**(*required*) The code acquired by directing users to /oauth2/1/authorize?response_type=code.
- **grant_type**(*required*) The grant type, which must be authorization_code.
- **client_id** (*required*) If credentials are passed in POST parameters, this parameter should be present and should be the app key/client id.
- **client_secret** (*required*) If credentials are passed in POST parameters, this parameter should be present and should be the app's secret.
- **redirect_uri**(*required*) Only used to validate that it matches the original /oauth2/authorize, not used to redirect again.
- **code_verifier**(*required if code_challenge parameter is passed in authorization request*) The code_verifier created during authorization request. This parameter is mandatory for mobile client applications.

RETURNS

A JSON string containing following fields will be returned in response:

- **access_token** The access token that can be used to call the DigiLocker APIs.
- **expires_in** The duration in seconds for which the access token is valid.
- **token_type** The type of token which will always be Bearer.

- **scope** Scope of the token provided by the user and scopes are separated by space.
For example : files.issuiddocs(Access to user's Get List of Issued Documents API) files.uploadedddocs(Access to user's Get List of uploaded Documents API) userdetails(Access to user's Get Account Details API) file.partners/PANCR(Access to user's Pull Document API for fetching new PAN Card) file.partners/DRVLC(Access to user's Pull Document API for fetching new Driving License) issued/in.gov.pan-PANCR-ABCDE1234F(Access to user's Get File From URI API for PAN Card) issued/in.gov.transport-DRVLC-DL0120230100001(Access to user's Get File From URI API for Driving License) openid(Access to user's in id_token)
- **consent_valid_till** This contain the timestamp in UNIX format that carry information about the consent expire provided by the user .
- **refresh_token** The refresh token used to refresh the above access token when it expires. Please refer to Refresh Access Token API for more details.
- **digilockerid** A unique 36 character DigiLocker Id of the user account.
- **name** The name of the user as registered with DigiLocker.
- **dob** This is date of birth of the user as registered with DigiLocker in DDMMYYYY format.
- **gender** This is gender of the user as registered with DigiLocker. The possible values are M, F, T for male, female and transgender respectively.
- **eaadhaar** This indicates whether eAadhaar data is available for this account. Possible values are Y and N.
- **new_account** This indicates whether the user's account existed earlier or the user signed up on DigiLocker during the authorization code flow. Possible values are Y and N.
- **reference_key** This is DigiLocker account reference key. This is used only as a transient reference for tracing.
- **mobile** The mobile number of the user as registered with DigiLocker.
- **purpose** The purpose selected by the user on the consent screen.

Sample Response:

```
{
  "access_token": "bc125c212a4b03a9a188a858be5a163f379e878a",

}
```

ERRORS

The authorization server responds with an HTTP status code as follows:

Code	Description
400	Bad request.
401	If the access token is expired or has been revoked by DigiLocker user.

Refresh Access Token

Access tokens have limited life and expire periodically. Client applications can refresh an access token without requiring the user to provide frequent authorizations by logging in to DigiLocker again and again. The client application uses the refresh token obtained in the Get Access Token API response. If the call is successful, new access and refresh tokens are returned.

URL STRUCTURE

Production Environment:

<https://digilocker.meripehchaan.gov.in/public/oauth2/1/token>

HTTP METHOD POST

HTTP REQUEST HEADER

- **Authorization:** Basic <client credentials> Use HTTP basic authentication of the client using the client_id and client_secret issued to your application.
- **Content-Type:** application/x-www-form-urlencoded

PARAMETERS

- **refresh_token** The refresh token obtained in the response of Get Access token API.
- **grant_type** The grant type, which must be *refresh_token*.

RETURNS

A JSON string containing following fields will be returned in response:

- **access_token** The new access token that can be used to call the DigiLocker APIs.
- **expires_in** The duration in seconds for which the access token is valid.
- **token_type** The type of token which will always be Bearer.
- **scope** Scope of the token provided by the user and scopes are separated by space.
For example : files.issueddocs(Access to user's Get List of Issued Documents API) files.uploadeddocs(Access to user's Get List of uploaded Documents API) userdetails(Access to user's Get Account Details API) partners.PANCR(Access to user's Pull Document API for fetching new PAN Card) partners.DRVLC(Access to user's Pull Document API for fetching new Driving License) issued/in.gov.pan-PANCR-ABCDE1234F(Access to user's Get File From URI API for PAN Card) issued/in.gov.transport-DRVLC-

DL0120230100001(*Access to user's Get File From URI API for Driving License*) openid(*Access to user's in id_token*)

- **consent_valid_till** This contain the timestamp in UNIX format that carry information
- **refresh_token** The refresh token used to refresh the above access token when it expires.
- **digilockerid** A unique 36 character DigiLocker Id of the user account.
- **name** The name of the user as registered with DigiLocker.
- **dob** This is date of birth of the user as registered with DigiLocker in DDMMYYYY format.
- **gender** This is gender of the user as registered with DigiLocker. The possible values are M, F, T for male, female and transgender respectively.
- **eaadhaar** This indicates whether eAadhaar data is available for this account. Possible values are Y and N.
- **reference_key** This is DigiLocker account reference key. This is used only as a transient reference for tracing.

Sample Response:

```
{
  "access_token": "11d539dafa5e6b11fe39a5ec266f32c902895485",
  "expires_in": 3600,
  "token_type": "Bearer",
  "scope": "userdetails files.issueddocs partners.PANCR",
  "consent_valid_till": 1684731048
  "refresh_token": "780506388c6425e551520316bfee16139c200103",
  "digilockerid": "123e4567-e89b-12d3-a456-426655440000",
  "name": "Ajit Kumar",
  "dob": "31121970",
  "gender": "M",
  "eaadhaar": "Y",

  "2a33349e7e606a8ad2e30e3c84521f9377450cf09083e162e0a9b1480ce0f972"
}
```

ERRORS

If the request fails due to missing, invalid, or mismatching parameters, the flow will result in error response. The following parameters will be included in the redirect URI:

- **error** An error code.
- **error_description** A user-friendly description of the error that occurred.

Sample Error Response:

```
HTTP/1.1 400 Bad Request
Content-Type: application/json; charset=UTF-8

{
  "error": "invalid_grant_type",
```

```
"error_description": "The grant_type parameter is invalid"
}
```

The following table lists the possible error codes:

Error	error_description	HTTP Response Code
invalid_client	The client credentials are invalid	400
invalid_grant	The refresh token is invalid	400
invalid_grant_type	The grant_type parameter is invalid	400
unexpected_error	Internal server error	500

Token/Session Revocation API

Revoke Token

Client applications can revoke a previously obtained refresh or access token when it is no longer needed. This is done by making a request to the token revocation endpoint. DigiLocker will invalidate the specified token and, if applicable, other tokens based on the same authorisation grant. This API may be used to sign out a user from DigiLocker. This API will work for server based web applications, mobile application and limited input devices.

URL STRUCTURE

```
Production Environment:
https://digilocker.meripehchaan.gov.in/public/oauth2/1/revoke
```

HTTP METHOD POST

HTTP REQUEST HEADER

- *Authorization: Basic <client credentials>* Use HTTP basic authentication of the client using the client_id and client_secret issued to your application.
- *Content-Type: application/x-www-form-urlencoded*

PARAMETERS

- **token**(*required*) The token that needs to be revoked.
- **token_type_hint**(*optional*) The type of the above token. The value will be one of *access_token* or *refresh_token*. If this parameter is not sent, DigiLocker will look for this token in both access and refresh tokens and then revoke it.

RETURNS

Since /oauth2/1/authorize is a website, there is no direct return value. However, once a user successfully authorizes your app, the DigiLocker application will forward the flow to your redirect URI. The type of response varies based on the response_type.

Revoke Session

This isn't an API call—it's a DigiLocker logout URL that gets the user session logged out. After calling this URL in the same web browser, Partner will be redirected to the redirect link as provided in the client ID settings section.

URL STRUCTURE

```
Production Environment:  
https://digilocker.meripehchaan.gov.in/signin/logout/Y
```

HTTP METHOD GET

PARAMETERS

- **client_id** (*required*) Provide the app id/client id that was created during the application registration process.
- **redirect_uri** (*required*) The URI to redirect the user after authorization has completed. This must be the exact URI registered in the DigiLocker Partner Portal.

RETURNS

Since /signin/logout/Y is a website, there is no direct return value. However, once a user successfully authorizes your app, the DigiLocker application will forward the flow to your redirect URI with `error=user_loggedout&error_description=user`

Account Detail API

Get User Details

Client applications can call this API to get the DigiLocker Id, name, date of birth and gender of the account holder. An access token is required to call this API. The API will return the user details of the account with which the access token is linked. It is strongly recommended that the API can be called by client application only once after acquiring the access token. Since the user details do not change, the client application may store the values and use them when necessary than calling this API repeatedly.

URL STRUCTURE

```
Production Environment:  
https://digilocker.meripehchaan.gov.in/public/oauth2/1/user
```

HTTP METHOD GET

HTTP REQUEST HEADER

- *Authorization: Bearer <access token>*

PARAMETERS

There are no parameters for this API.

RETURNS

Returns following user details in JSON format:

- **digilockerid** A unique 36 character DigiLocker Id of the user account.
- **name** The name of the user as registered with DigiLocker.

- **dob** This is date of birth of the user as registered with DigiLocker in DDMMYYYY format.
- **gender** This is gender of the user as registered with DigiLocker. The possible values are M, F, T for male, female and transgender respectively.
- **eaadhaar** This indicates whether eAadhaar data is available for this account. Possible values are Y and N.
- **reference_key** This is DigiLocker account reference key. This is used only as a transient reference for tracing.
- **mobile** This is mobile number of the user as registered with DigiLocker
- **picture** This is picture of the user as registered with DigiLocker
- **email** This is email ID of the user as registered with DigiLocker

Sample Response:

HTTP/1.1 200 OK

Content-Type: application/json

```
{
  "digilockerid": "123e4567-e89b-12d3-a456-426655440000",
  "name": "Ajit Kumar",
  "dob": "31121970",
  "gender": "M",
  "eaadhaar": "Y",
  "reference_key":
"2a33349e7e606a8ad2e30e3c84521f9377450cf09083e162e0a9b1480ce0f972"
  "mobile": "9999999999"
  "picture": "/9j/4AAQSkZJRgABAgAAAQABAAD/2wBDAAgGBgcGBQgHBwcJCQ
Ksjdhcvfiasdviassdv/sakbvjhas/aksjbfcijakjadnfcijabuw238923bi2jbc923fkdbc
iub/ksdjnji....."
  "email": "email@test.com"
}
```

ERRORS

If the request fails, corresponding HTTP status code will be returned along with the following parameters in the response:

- **error** An error code.
- **error_description** A user-friendly description of the error that occurred.

Sample Error Response:

HTTP/1.1 500 Internal Server Error

Content-Type: application/json; charset=UTF-8

```
{
  "error": "unexpected_error",
  "error_description": "Internal server error"
}
```

```
}

```

The following table lists the possible error codes:

Error	error_description	HTTP Response Code
invalid_token	The access token is invalid	401
insufficient_scope	The request requires higher privileges than provided by the access token	403
unexpected_error	Internal server error	530

Get APAAR Details

Client applications can call this API to get the APAAR Details of the account holder. An access token is required to call this API. The API will return the APAAR details of the account with which the access token is linked. It is strongly recommended that the API can be called by client application only once after acquiring the access token.

URL STRUCTURE

Production Environment:

`https://digilocker.meripehchaan.gov.in/public/oauth2/1/apaar`

HTTP METHOD GET

HTTP REQUEST HEADER

- *Authorization: Bearer <access token>*

PARAMETERS

There are no parameters for this API.

RETURNS

Returns following APAAR details in JSON format:

- **apaar_id** A unique 12-digit identifier of the student's APAAR account.
- **student_details** Container for personal and academic summary of the student.
- **academic_details** An array of academic records, each representing details from a university and associated courses.

Student Details (student_details)

- **name** Full name of the student as registered in the APAAR system.
- **dob** Date of birth of the student in DD/MM/YYYY format.
- **gender** Gender of the student. Possible values: Male, Female, Transgender.
- **created_on** Timestamp indicating when the APAAR ID was created.
- **cumulative_credit_points** Total cumulative credit points accumulated by the student.
- **cumulative_credit** Total credits earned/ accumulated by the student.

- **cumulative_grade_points** Total grade points accumulated by the student.

Academic Details (academic_details)

This is an array of objects, where each object contains:

University-Level Fields

- **university_name** Name of the Academic Institute from where the credits were deposited.
- **org_id** Last Organisation ID of the Academic Institute from where the credits were deposited.

Course-Level Fields (inside each courses[])

- **name** Name of the course.
- **subjects** List of subjects under the course, each with the following attributes:

Subject-Level Fields (inside each subjects[])

- **name** Subject name.
- **credit_points** Credit points earned for the subject.
- **credit** Credit value (typically corresponding to lecture hours).
- **grade_points** Grade points scored.
- **grade** Letter grade awarded.
- **stream** Stream or specialization under which the subject was taken.
- **session** Duration of the Academic Session (e.g., 2022–2023).
- **year** Year of the Examination Held.
- **month** Month in which the examination was held.
- **sem** Semester code (e.g., I, II, III...).

Sample Response:

HTTP/1.1 200 OK

Content-Type: application/json

```
{
  "status": "success",
  "status_code": "200",
  "message": "Record Found Successfully.",
  "apaar_id": "23481519XXXX",

            }
          ]
        }
      ]
    }
  ]
}
```

ERRORS

If the request fails, corresponding HTTP status code will be returned along with the following parameters in the response:

- **error** An error code.
- **error_description** A user-friendly description of the error that occurred.

Sample Error Response:

```
HTTP/1.1 500 Internal Server Error
Content-Type: application/json;charset=UTF-8

{
  "error": "unexpected_error",
  "error_description": "Internal server error"
}
```

The following table lists the possible error codes:

Error	error_description	HTTP Response Code
invalid_token	The access token is invalid	401
insufficient_scope	The request requires higher privileges than provided by the access token	403
apaar_not_linked	Apaar is not linked to the account	404
apaar_not_available	Apaar data is not available for this user.	404
unexpected_error	Internal server error	530

File APIs

File APIs allow your application to get the meta-data about issued and uploaded documents in user's DigiLocker. It allows downloading of a file from issued and uploaded documents. It also allows uploading of a file in uploaded document section of user's account.

Get List of Self Uploaded Documents

Returns the list of meta-data about documents or folders in user's DigiLocker in a specific location.

URL STRUCTURE

Production Environment:

`https://digilocker.meripehchaan.gov.in/public/oauth2/1/files/{id}`

HTTP METHOD GET

HTTP REQUEST HEADER

- *Authorization: Bearer <access token>*

PARAMETERS

- **id** The id of the folder to list. To list the files of root folder of a user's locker, do not send this parameter. This is sent as a part of the URL.

RETURNS

Returns meta-data about contents of a given folder in JSON format containing following fields in response:

- **name** The name of the file or folder.
- **type** String dir for folder and string file for file.
- **id** The id if this item is a folder.
- **size** Size of file or folder.
- **date** This contains the date of file upload in case of self uploaded documents.
- **parent** The id of the parent folder.
- **mime** The mime type of the file. This field will contain "application/pdf" for PDF files; "image/png" for PNG files and "image/jpg" or "image/jpeg" for JPG/JPEG files. This will be blank in case of folder.
- **uri** This is the unique identifier of the document shared by the user in DigiLocker. You will use this identifier to get the actual file from DigiLocker using the API. URI will be blank in case of folder.
- **description** This is the descriptive document type stored in DigiLocker such as 'Income Certificate' or 'Driving License'.
- **issuer** The name of the issuer. This is blank in case of uploaded documents and folders.

Sample Response:

```
{
  "directory": "/",
  "items": [
    {
      "name": "My Documents",
      "type": "dir",
      "id": "5678",
      "size": "366481",
      "date": " 2015-05-12T15:50:38Z",
      "parent": "1234",
      "mime": "",
      "uri": "",
      "description": ""
    }
  ]
}
```

```

        "issuer": ""
    },
    {
        "name": "myfile.pdf",
        "type": "file",
        "id": "",
        "size": "366481",
        "date": " 2015-05-12T15:50:38Z",
        "parent": "1234",
        "mime": "application/pdf",
        "uri": "in.gov.digilocker-OTHER-39491058586222",
        "description": "Income Certificate",
        "issuer": ""
    }
]
}

```

ERRORS

If the request fails due to a missing, invalid, or mismatching redirection URI, or if the client identifier is missing or invalid, the flow will result in error response.

If the request fails for reasons other than a missing or invalid redirection URI, corresponding HTTP status code will be returned along with the following parameters in the response:

- **error** An error code.
- **error_description** A user-friendly description of the error that occurred.

Sample Error Response:

HTTP/1.1 404 Not Found

Content-Type: application/json; charset=UTF-8

```

{
  "error": "invalid_id",
  "error_description": "The folder does not exist"
}

```

The following table lists the possible error codes:

Error	error_description	HTTP Response Code
invalid_token	The access token is invalid	401
invalid_id	The folder does not exist	404
insufficient_scope	The request requires higher privileges than provided by the access token	403
unexpected_error	Internal server error	530

Get List of Issued Documents

Returns the list of meta-data about issued documents in user's DigiLocker.

URL STRUCTURE

Production Environment:

`https://digilocker.meripehchaan.gov.in/public/oauth2/2/files/issued`

HTTP METHOD GET

HTTP REQUEST HEADER

- *Authorization: Bearer <access token>*

PARAMETERS

There are no parameters for this API.

RETURNS

Returns meta-data about issued documents in JSON format containing following fields in response:

- **name** The name of the certificate.
- **type** String file.
- **size** This will be blank.
- **date** This contains the date on which the certificate was last modified in DigiLocker.
- **parent** This will be blank.
- **mime** The list of mime types for the certificate data. This field will contain "application/pdf" or "application/xml".
- **uri** This is the unique identifier of the document shared by the user in DigiLocker. You will use this identifier to get the actual file from DigiLocker using the API.
- **doctype** A 5 character unique document type provided by DigiLocker.
- **description** This is the descriptive document type stored in DigiLocker such as 'Income Certificate' or 'Driving License'.
- **issuerid** Unique DigiLocker issuer id as mentioned in the URI.
- **issuer** The name of the issuer.

Sample Response:

```
{
  "items": [
    {
      "name": "Class XII Marksheet",
      "type": "file",
      "size": "",
      "date": "2015-05-12T15:50:38Z",
      "parent": "",
      "mime": "application/pdf",
      "uri": "in.gov.cbse-HSCER-201412345678",
      "doctype": "HSCER",
      "description": "Class XII Marksheet",
      "issuerid": "in.gov.cbse",
      "issuer": "CBSE"
    },
    {
```

```
{
  "name": "Income Certificate",
  "type": "file",
  "size": "",
  "date": " 2015-05-12T15:50:38Z",
  "parent": "",
  "mime": [{"application/pdf"}, {"application/xml"}],
  "uri": " in.gov.delhi-INCER-98765432",
  "doctype": "INCER",
  "description": "Income Certificate",
  "issuerid": "in.gov.delhi",
  "issuer": "Delhi eDistrict"
}
```

ERRORS

If the request fails due to a missing, invalid, or mismatching redirection URI, or if the client identifier is missing or invalid, the flow will result in error response.

If the request fails for reasons other than a missing or invalid redirection URI, corresponding HTTP status code will be returned along with the following parameters in the response:

- **error** An error code.
- **error_description** A user-friendly description of the error that occurred.

Sample Error Response:

HTTP/1.1 500 Internal Server Error

Content-Type: application/json;charset=UTF-8

```
{
  "error": " partner_service_unresponsive ",
  "error_description": "Internal server error"
}
```

The following table lists the possible error codes:

Error	error_description	HTTP Response Code
invalid_token	The access token is invalid	401
insufficient_scope	The request requires higher privileges than provided by the access token	403
partner_service_unresponsive	Internal server error	530
unexpected_error	Internal server error	530

Get File from URI

Returns a file from URI. This API can be used to fetch both issued document and uploaded document.

URL STRUCTURE

Production Environment:

`https://digilocker.meripehchaan.gov.in/public/oauth2/1/file/uri`

HTTP METHOD GET

HTTP REQUEST HEADER

- *Authorization: Bearer <access token>*

PARAMETERS

- **uri** The URI of the file to download. This is sent as a part of the url.

HTTP RESPONSE HEADER

- **Content-Type** The mime type of the file e.g. image/jpg, image/jpeg, image/png, application/pdf
- **Content-Length** Size of file.
- **hmac** This is used to verify the integrity of the file data. DigiLocker calculates the hash message authentication code (hmac) of the file content using SHA256 hashing algorithm and the client secret as the hashing key. The resulting hmac is converted to Base64 format and sent in this parameter. It is strongly recommended that the client app calculates the hmac of the downloaded file data and compares it with this hmac.

RETURNS

Returns data of the file in the response body.

ERRORS

If the request fails due to a missing, invalid, or mismatching redirection URI, or if the client identifier is missing or invalid, the flow will result in error response.

If the request fails for reasons other than a missing or invalid redirection URI, corresponding HTTP status code will be returned along with the following parameters in the response:

- **error** An error code.
- **error_description** A user-friendly description of the error that occurred.

Sample Error Response:

HTTP/1.1 400 Bad Request

Content-Type: application/json; charset=UTF-8

```
{
  "error": "uri_missing",
  "error_description": "URI parameter missing"
}
```

The following table lists the possible error codes:

Error	error_description	HTTP Response Code
invalid_token	The access token is invalid	401
uri_missing	URI parameter missing	400

insufficient_scope	The request requires higher privileges than provided by the access token	403
invalid_uri	No file found for given URI	404
repository_service_resperror	Internal server error	530
repository_service_exception	Internal server error	530

Get Certificate Data in XML Format from URI

Returns the certificate data in machine readable XML format for a URI. This API can be used only for issued documents. The XML data may not be available for all documents. If the XML data is available for a particular document, the *mime* parameter in Get List of Issued Documents API will contain *application/xml*. Please refer to DigiLocker XML Certificate Formats for more details of XML formats of various documents.

URL STRUCTURE

Production Environment:

`https://digilocker.meripehchaan.gov.in/public/oauth2/1/xml/uri`

HTTP METHOD GET

HTTP REQUEST HEADER

- *Authorization: Bearer <access token>*

PARAMETERS

- **uri** The URI of the file to download. This is sent as a part of the url.

HTTP RESPONSE HEADER

- **Content-Type** The mime type of the file which will be application/xml
- **Content-Length** Size of file.
- **hmac** This is used to verify the integrity of the file data. DigiLocker calculates the hash message authentication code (HMAC) of the file content using SHA256 hashing algorithm and the client secret as the hashing key. The resulting HMAC is converted to Base64 format and sent in this parameter. It is strongly recommended that the client app calculates the HMAC of the downloaded file data and compares it with this HMAC.

RETURNS

Returns XML file containing certificate data in the response body.

ERRORS

If the request fails due to a missing, invalid, or mismatching redirection URI, or if the client identifier is missing or invalid, the flow will result in error response.

If the request fails for reasons other than a missing or invalid redirection URI, corresponding HTTP status code will be returned along with the following parameters in the response:

- **error** An error code.
- **error_description** A user-friendly description of the error that occurred.

Sample Error Response:

```
HTTP/1.1 400 Bad Request
Content-Type: application/json;charset=UTF-8

{
  "error": "uri_missing",
  "error_description": "URI parameter missing"
}
```

The following table lists the possible error codes:

Error	error_description	HTTP Response Code
invalid_token	The access token is invalid	401
uri_missing	URI parameter missing	400
insufficient_scope	The request requires higher privileges than provided by the access token	403
invalid_uri	No file found for given URI	404
repository_service_resperror	Internal server error	530
repository_service_exception	Internal server error	530

Get e-Aadhaar Data in XML Format

Returns e-Aadhaar data in XML format for the account.

URL STRUCTURE

Production Environment:

<https://digilocker.meripehchaan.gov.in/public/oauth2/3/xml/eaadhaar>

HTTP METHOD GET

HTTP REQUEST HEADER

- *Authorization: Bearer <access token>*

HTTP RESPONSE HEADER

- **Content-Type** The mime type of the file which will be application/xml
- **Content-Length** Size of file.
- **hmac** This is used to verify the integrity of the file data. DigiLocker calculates the hash message authentication code (HMAC) of the file content using SHA256 hashing algorithm and the client secret as the hashing key. The resulting HMAC is converted to Base64 format and sent in this parameter. It is strongly recommended that the client app calculates the HMAC of the downloaded file data and compares it with this HMAC.

RETURNS

Returns XML file containing e-Aadhaar data in the response body.

ERRORS

If the client identifier is missing or invalid, the flow will result in error response with corresponding HTTP status code will be returned along with the following parameters in the response:

- **error** An error code.
- **error_description** A user-friendly description of the error that occurred.

Sample Error Response:

```
HTTP/1.1 400 Bad Request
```

```
Content-Type: application/json;charset=UTF-8
```

```
{
  "error": "uri_missing",
  "error_description": "URI parameter missing"
}
```

The following table lists the possible error codes:

Error	error_description	HTTP Response Code
invalid_token	The access token is invalid	401
insufficient_scope	The request requires higher privileges than provided by the access token	403
aadhaar_not_linked	Aadhaar is not linked to the account	404
aadhaar_not_available	Aadhaar data is not available for this user. Please perform Aadhaar eKYC again.	404
repository_service_exception	Internal server error	530
unexpected_error	Internal server error	530
internal_server_error	Internal server error	530

Upload File to DigiLocker

This API can be used to save/upload a file to uploaded documents in DigiLocker. The allowed file types are JPG, JPEG, PNG and PDF. The file size must not exceed 10MB.

URL STRUCTURE

Production Environment:

```
https://digilocker.meripehchaan.gov.in/public/oauth2/1/file/upload
```

HTTP METHOD POST

HTTP REQUEST HEADER

- *Authorization: Bearer <access token>*

- **Content-Type** The mime type of the file e.g. image/jpg, image/jpeg, image/png, application/pdf
- **path** The destination path of the file in DigiLocker including filename.
- **hmac** This is used to verify the integrity of the file data. The client app calculates the hash message authentication code (HMAC) of the file content using SHA256 hashing algorithm and the client secret as the hashing key. The resulting HMAC is converted to Base64 format and sent in this parameter. Upon upload of file, DigiLocker calculates the HMAC of the file data and compares it with this HMAC.

HTTP REQUEST BODY

Provide data of the file in the request body.

RETURNS

Returns meta-data about the uploaded document in JSON format containing following fields in response:

- **path** The destination path of the file in DigiLocker including filename.
- **size** Size of file.

ERRORS

If the request fails due to a missing, invalid, or mismatching redirection URI, or if the client identifier is missing or invalid, the flow will result in error response.

If the request fails for reasons other than a missing or invalid redirection URI, corresponding HTTP status code will be returned along with the following parameters in the response:

- **error** An error code.
- **error_description** A user-friendly description of the error that occurred.

Sample Error Response:

```
HTTP/1.1 400 Bad Request
```

```
Content-Type: application/json;charset=UTF-8
```

```
{
  "error": "contenttype_missing",
  "error_description": "Content-Type parameter is missing"
}
```

The following table lists the possible error codes:

Error	error_description	HTTP Response Code
invalid_token	The access token is invalid	401
insufficient_scope	The request requires higher privileges than provided by the access token	403
path_missing	Path parameter is missing	400
contenttype_missing	Content-Type parameter is missing	400
hmac_missing	HMAC parameter is missing	400
filename_missing	Filename is missing in path parameter	400
hmac_mismatch	HMAC does not match	400
invalid_filename	Restricted characters (\ / : * ? < > ' ^ and ~) are not allowed in file name	400

invalid_filesize	The file size exceeds maximum allowed file size of 10MB	400
invalid_filetype	The file type is not allowed	400
invalid_path	The destination folder does not exist	400
file_data_missing	Missing file content in the request	400
mimetype_mismatch	The mimetype provided in Content-Type parameter does not match with the mimetype of the file	400
unexpected_error	Internal server error	530

Pull Document

This API allows a client application to search a document/certificate from issuer's repository using the parameters provided by a user. The searched document is saved in user's issued document section of DigiLocker if the search is successful.

URL STRUCTURE

Production Environment:

`https://digilocker.meripehchaan.gov.in/public/oauth2/1/pull/pulldocument`

HTTP METHOD POST

HTTP REQUEST HEADER

- *Authorization: Bearer <access token>*
- *Content-Type: application/x-www-form-urlencoded*

PARAMETERS

- **orgid** The organization id for the issuer in DigiLocker. This organization id is returned in Get List of Issuers API mentioned above.
- **doctype** A 5 character unique document type provided by DigiLocker. The doctype is returned in Get List of Documents API mentioned above.
- **consent** The consent indicator from the user for sharing his Aadhaar details with the issuer for pulling the document into his/her DigiLocker. The Partner Application must capture the consent from the user. The possible values are "Y" and "N". The pull request will be processed only when this indicator is "Y". The client application must display following consent text to the user and capture user's consent:

I provide my consent to share my Aadhaar Number, Date of Birth and Name from my Aadhaar eKYC information with the <Issuer Name> for the purpose of fetching my <Certificate Name> into DigiLocker.

The <Issuer Name> in above text will be replaced by the name of the issuer as returned in Get List of Issuers API. The <Certificate Name> will be replaced by the description returned in Get List of Documents API.

- Other parameters required for fetching a document as listed in *paramname* field of Get Search Parameters API.

RETURNS

If a document/certificate is found in issuer's repository with the given criteria, the corresponding URI of the document will be saved in Issued Documents section of DigiLocker and HTTP status code 200 will be returned. This URI will also be returned in response as follows:

- **uri** indicates URI of the pulled document.

Sample Response:

```
{
  "uri": "in.gov.cbse-HSCER-201412345678"
}
```

ERRORS

If the request fails, corresponding HTTP status code will be returned along with the following parameters in the response:

- **error** An error code.
- **error_description** A user-friendly description of the error that occurred.

Sample Error Response:

```
HTTP/1.1 500 Internal Server Error
Content-Type: application/json;charset=UTF-8

{
  "error": "unexpected_error",
  "error_description": "Internal server error"
}
```

The following table lists the possible error codes:

Error	error_description	HTTP Response Code
invalid_token	The access token is invalid	401
insufficient_scope	The request requires higher privileges than provided by the access token	403
invalid_orgid	The orgid parameter is missing or invalid	400
invalid_doctype	The doctype parameter is missing or invalid	400
repository_service_configerror	The issuer service is not available. Please contact DigiLocker support.	500
pull_response_pending	The details provided above do not exactly match with the details on the certificate. Your request has been forwarded to the Issuer department. The Issuer department will verify the	400

	details provided above. If the verification is successful, your certificate will be made available in the Issued Documents section of your DigiLocker.	
uri_exists	This document already exists in your Issued Documents.	400
record_not_found	No record found in issuer database for given criteria. Please check the details and try again. If problem persists, see the FAQ section for possible causes.	404
aadhaar_not_linked	To access issued documents, please link your Aadhaar number to your DigiLocker account.	400
unexpected_error	Internal server error	500

DigiLocker Meta APIs

DigiLocker Meta APIs provide information about a user account, issuers, document types and parameters required to pull a document. These APIs do not require user's authorization using OAuth flow as they do not access documents/folders from user's account. These APIs can be accessed using the Client Secret Key provided to your application from the DigiLocker Partner's Portal. It is strongly recommended that client applications cache this metadata with them to limit the number of calls to these APIs as this information does not change frequently.

Get List of Issuers

Returns the list of issuers registered with DigiLocker.

URL STRUCTURE

Production Environment:

`https://digilocker.meripehchaan.gov.in/public/oauth2/1/pull/issuers`

HTTP METHOD POST

PARAMETERS

- **clientid** Provide the client id that was created during the application registration process on Partners Portal.
- **ts** Provide a timestamp value in UNIX (or POSIX) format in IST time zone in seconds. This timestamp value must not be older than 30 minutes.
- **hmac** Provide SHA-256 encrypted value of the client secret, *clientid* and *ts* parameters above concatenated in this sequence (client secret, *clientid*, *ts*). The hmac parameter is used by DigiLocker to ensure the data integrity and authentication of the request. Use the Client Secret Key generated during the application registration process on Partners Portal as the client secret.

RETURNS

Returns HTTP status code 200 along with a JSON list of issuers containing following fields:

- **orgid** A unique numeric identifier of the issuer organization.
- **issuerid** Unique DigiLocker issuer id as mentioned in the URI.
- **name** Name of the issuer organization.
- **category** A comma separated list of categories that define this issuer. The predefined issuer categories are Central Government, State Government, Education and Insurance.
- **description** A description about the issuer organization and the document it provides.

Sample Response:

HTTP/1.1 200 OK

Content-Type: application/json

```
{
  "issuers": [
    {
      "orgid": "000018",
      "issuerid": "in.gov.cbse",
      "name": "Central Board of Secondary Education, Delhi",
      "category": "Education, Central Government",
      "description": "CBSE (http://www.cbse.nic.in/) is issuing marksheets, passing certificates, migration certificates etc. through DigiLocker. These are either pushed, or can be pulled by students into their DigiLocker accounts."
    },
    {
      "orgid": "000201",
      "issuerid": "in.gov.aktu",
      "name": "APJ Abdul Kalam Technical University, UP",
      "category": "Education, State Government",
      "description": "APJ Abdul Kalam Technical Univeristy, Uttar Pradesh provides the mark sheets of degree certificates of various technical programs."
    }
  ]
}
```

ERRORS

If the request fails, corresponding HTTP status code will be returned along with the following parameters in the response:

- **error** An error code.
- **error_description** A user-friendly description of the error that occurred.

Sample Error Response:

```
HTTP/1.1 500 Internal Server Error
Content-Type: application/json;charset=UTF-8

{
  "error": "unexpected_error",
  "error_description": "Internal server error"
}
```

The following table lists the possible error codes:

Error	error_description	HTTP Response Code
invalid_client_id	The client_id parameter is invalid	401
invalid_parameter	One or more of the mandatory parameters is missing or invalid. The error description text will contain one or more of the following error texts: - Timestamp parameter is missing or invalid - HMAC parameter is missing or invalid	400
unexpected_error	Internal server error	500

Get List of Documents Provided by an Issuer

Returns a list of documents/certificates issued by an issuer organization registered with DigiLocker.

URL STRUCTURE

Production Environment:

```
https://digilocker.meripehchaan.gov.in/public/oauth2/1/pull/doctype
```

HTTP METHOD POST

PARAMETERS

- **clientid** Provide the client id that was created during the application registration process on Partners Portal.
- **orgid** The organization id of the issuer in DigiLocker. The API will return the list of document types issued by this issuer. This organization id can be found in the issuer information returned in Get List of Issuers API mentioned earlier. This parameter is sent as a part of the url.
- **ts** Provide a timestamp value in UNIX (or POSIX) format in IST time zone in seconds. This timestamp value must not be older than 30 minutes.
- **hmac** Provide SHA-256 encrypted value of the client secret, *clientid*, *orgid* and *ts* parameters above concatenated in this sequence (client secret, *clientid*, *orgid*, *ts*). The hmac parameter is used by DigiLocker to ensure the data integrity and authentication

of the request. Use the Client Secret Key generated during the application registration process on Partners Portal as the client secret.

RETURNS

Returns HTTP status code 200 along with a JSON list of document types in the response. The JSON containing following fields:

- **doctype** A 5 character unique document type provided by DigiLocker.
- **description** The descriptive name of the document type.

Sample Response:

HTTP/1.1 200 OK

Content-Type: application/json

```
{
  "documents": [
    {
      "doctype": "INCER",
      "description": "Income Certificate"
    },
    {
      "doctype": "BTCER",
      "description": "Birth Certificate"
    }
  ]
}
```

ERRORS

If the request fails, corresponding HTTP status code will be returned along with the following parameters in the response:

- **error** An error code.
- **error_description** A user-friendly description of the error that occurred.

Sample Error Response:

HTTP/1.1 500 Internal Server Error

Content-Type: application/json; charset=UTF-8

```
{
  "error": "unexpected_error",
  "error_description": "Internal server error"
}
```

The following table lists the possible error codes:

Error	error_description	HTTP Response Code
invalid_client_id	The client_id parameter is invalid	401
invalid_parameter	One or more of the mandatory parameters is missing or invalid. The	400

	error description text will contain one or more of the following error texts: • The orgid parameter is missing or invalid • Timestamp parameter is missing or invalid • HMAC parameter is missing or invalid	
unexpected_error	Internal server error	500

Get Search Parameters for a Document

Returns a list of parameters required to search a document/certificate of an issuer organization registered with DigiLocker. These parameters are used to pull a document from issuer's repository using Pull Document API mentioned in subsequent section.

URL STRUCTURE

Production Environment:

`https://digilocker.meripehchaan.gov.in/public/oauth2/1/pull/parameters`

HTTP METHOD POST

PARAMETERS

- **clientid** Provide the client id that was created during the application registration process on Partners Portal.
- **orgid** The organization id for the issuer in DigiLocker. This organization id is returned in Get List of Issuers API mentioned earlier.
- **doctype** A 5 character unique document type provided by DigiLocker. The doctype is returned in Get List of Documents API mentioned earlier.
- **ts** Provide a timestamp value in UNIX (or POSIX) format in IST time zone in seconds. This timestamp value must not be older than 30 minutes.
- **hmac** Provide SHA-256 encrypted value of the client secret, *clientid*, *orgid*, *doctype* and *ts* parameters above concatenated in this sequence (client secret, *clientid*, *orgid*, *doctype*, *ts*). The hmac parameter is used by DigiLocker to ensure the data integrity and authentication of the request. Use the Client Secret Key generated during the application registration process on Partners Portal as the client secret.

RETURNS

Returns HTTP status code 200 along with a JSON list of parameters in the response. The parameter list contains following fields:

- **label** The text label of the parameter. This can be used by the calling application as a label for the input field that accepts the parameter from the user.
- **paramname** The name of the parameter. This field will be used as the parameter name while calling the Pull Document API.
- **valuelist** If the parameter takes a value from a set of possible values (dropdown) then this field will provide a comma separated list of values. Otherwise this field will be null.

- **example** An example of the input value. This can be used by the calling application to show an example of the input value to the user.

Sample Response:

```
HTTP/1.1 200 OK
Content-Type: application/json

{
  "parameters": [
    {
      "label": "Year",
      "paramname": "year",
      "valuelist": "2001,2002,2003,2004",
      "example": "2002",
    },
    {
      "label": "Roll Number",
      "paramname": "rollno",
      "valuelist": null,
      "example": "C525690",
    }
  ]
}
```

ERRORS

If the request fails, corresponding HTTP status code will be returned along with the following parameters in the response:

- **error** An error code.
- **error_description** A user-friendly description of the error that occurred.

Sample Error Response:

```
HTTP/1.1 500 Internal Server Error
Content-Type: application/json; charset=UTF-8

{
  "error": "unexpected_error",
  "error_description": "Internal server error"
}
```

The following table lists the possible error codes:

Error	error_description	HTTP Response Code
invalid_client_id	The client_id parameter is invalid	401
invalid_parameter	One or more of the mandatory parameters is missing or invalid. The	400

	error description text will contain one or more of the following error texts: • The orgid parameter is missing or invalid • The doctype parameter is missing or invalid • Timestamp parameter is missing or invalid • HMAC parameter is missing or invalid	
unexpected_error	Internal server error	500

Push URI to Account

The API can use to push or delete a single URI into DigiLocker using DigiLocker Id acquired using Get User Details API. This API can be used to push the certificate details to DigiLocker as and when a certificate is generated in the issuer system. The issuing departments must register on DigiLocker as a registered Issuer and implement the requisite Issuer APIs as mentioned in DigiLocker Issuer API Specification document prior to pushing certificates using this API.

URL STRUCTURE

Production Environment:

`https://digilocker.meripehchaan.gov.in/public/account/1/pushuri`

HTTP METHOD POST

PARAMETERS

- **clientid** Provide the client id that was created during the application registration process on Partners Portal.
- **digilockerid** This is the DigiLocker Id of the user that was acquired using Get User Details API.
- **uri** This is the unique identifier of the document.
- **doctype** A 5 character unique document type provided by DigiLocker.
- **description** The descriptive name of the document type.
- **docid** A unique number of the document. This id will be unique within the document type issued by the issuer.
- **issuedate** The issue date of the document in DDMMYYYY format.
- **validfrom**(*optional*) The date from which the document is valid in DDMMYYYY format. This may be same as the issue date.
- **validto**(*optional*) The expiry date of the document in DDMMYYYY format.
- **action** Action that needs to be taken for the Aadhaar number and URI combination. Possible values are A for adding a new URI, U for updating an already added URI details or D for deleting the URI.
- **ts** Provide a timestamp value in UNIX (or POSIX) format in IST time zone in seconds. This timestamp value must not be older than 30 minutes.
- **doccontent**(*optional*) Provide a base64 encoded string of pdf certificate.

- **datacontent**(*optional*) Provide a base64 encoded string of xml metadata certificate.
- **hmac** Provide SHA-256 encrypted value of the client secret, *clientid*, *digilockerid*, *uri*, *doctype*, *description*, *docid*, *issuedate*, *validfrom*, *validto*, *action* and *ts* parameters above concatenated in this sequence (client secret, *clientid*, *digilockerid*, *uri*, *doctype*, *description*, *docid*, *issuedate*, *validfrom*, *validto*, *action*, *ts*, *doccontent*, *datacontent*). The hmac parameter is used by DigiLocker to ensure the data integrity and authentication of the request. Use the Client Secret Key generated during the application registration process on Partners Portal as the client secret.

RETURNS

If the API call succeeds, HTTP status code 200 will be returned. This API does not return any specific values.

ERRORS

If the request fails, corresponding HTTP status code will be returned along with the following parameters in the response:

- **error** An error code.
- **error_description** A user-friendly description of the error occurred.

Sample Error Response:

```
HTTP/1.1 400 Bad Request
```

```
Content-Type: application/json;charset=UTF-8
```

```
{
  "error": "invalid_parameter ",
  "error_description": "Timestamp parameter is missing or invalid"
}
```

The following table lists the possible error codes:

Error	error_description	HTTP Response Code
invalid_client_id	The client_id parameter is invalid	401
insufficient_scope	The request requires higher privileges	403
invalid_digilocker_id	The digilockerid parameter is invalid	404
invalid_parameter	One or more of the mandatory parameters is missing or invalid. The error description text will contain one or more of the following error texts: • URI parameter is missing or invalid • Doctype parameter is missing or invalid • Description parameter is missing or invalid • Docid parameter is missing or invalid • Issuedate parameter is missing or invalid	400

	• Timestamp parameter is missing or invalid • HMAC parameter is missing or invalid • URI already exists in this account • URI already exists in another account	
unexpected_error	Internal server error	500

Get Statistics

Returns DigiLocker statistics such as the count of users, authentic documents, issuers and requesters as on a specific date.

URL STRUCTURE

Production Environment:
<https://digilocker.meripehchaan.gov.in/public/statistics/1/counts>

HTTP METHOD POST

PARAMETERS

- **clientid** Provide the client id that was created during the application registration process on Partners Portal.
- **ts** Provide a timestamp value in UNIX (or POSIX) format in IST time zone in seconds. This timestamp value must not be older than 30 minutes.
- **hmac** Provide SHA-256 encrypted value of the client secret, *clientid* and *ts* parameters above concatenated in this sequence (client secret, *clientid*, *ts*). The hmac parameter is used by DigiLocker to ensure the data integrity and authentication of the request. Use the Client Secret Key generated during the application registration process on Partners Portal as the client secret.

RETURNS

Returns HTTP status code 200 along with a count of various parameters in JSON format as follows:

- **users** Count of registered users on DigiLocker.
- **authentic_documents** Count of authentic documents available through DigiLocker.
- **issuers** Count of issuer organizations registered on DigiLocker.
- **requesters** Count of requester organizations registered on DigiLocker.
- **count_as_on** The date on which this statistics is generated.
- **monthwise_registrations** List of last 12 months cumulative user registrations
- **id** Unique id of the list item
- **month** Month of the year in numeric format with January as 1
- **year** Year in YYYY format
- **count** Count of cumulative user registrations in the given month
- **yearwise_authentic_documents** List of cumulative year-wise counts of authentic documents in DigiLocker
- **id** Unique id of the list item

- **year** Year in YYYY format
- **count** Count of cumulative user authentic documents in the given year

Sample Response:

HTTP/1.1 200 OK

Content-Type: application/json

```
{
  "users": "25873490",
  "authentic_documents": "3520475277",
  "issuers": "134",
  "requesters": "45",
  "count_as_on": "31072019",
  "monthwise_registrations": [
    {
      "id": "18496",
      "month": "5",
      "year": "2018",
      "count": "124794"
    },
    {
      "id": "18497",
      "month": "6",
      "year": "2018",
      "count": "135455"
    }
  ],
  "yearwise_authentic_documents": [
    {
      "id": "18347",
      "year": "2016",
      "count": "10134567"
    },
    {
      "id": "18350",
      "year": "2017",
      "count": "1000548093"
    },
    {
      "id": "18354",
      "year": "2018",
      "count": "2410543684"
    }
  ]
}
```

```

    "id": "18567",
    "year": "2019",
    "count": "3520475277"
  }
]
}

```

ERRORS

If the request fails, corresponding HTTP status code will be returned along with the following parameters in the response:

- **error** An error code.
- **error_description** A user-friendly description of the error that occurred.

Sample Error Response:

```

HTTP/1.1 500 Internal Server Error
Content-Type: application/json;charset=UTF-8

{
  "error": "unexpected_error",
  "error_description": "Internal server error"
}

```

The following table lists the possible error codes:

Error	error_description	HTTP Response Code
invalid_client_id	The client_id parameter is invalid	401
invalid_parameter	One or more of the mandatory parameters is missing or invalid. The error description text will contain one or more of the following error texts: • Timestamp parameter is missing or invalid • HMAC parameter is missing or invalid	400
unexpected_error	Internal server error	500
